

PACKAGING GUIDELINES FOR SGL MATERIALS

INTRODUCTION: The "SGL" product line manufactured by Auburn Manufacturing, Inc. is silicone-coated fiberglass fabric that is susceptible to abrasion. For this reason, fabricated items made with these materials must be packaged carefully before re-shipping.

PACKAGING:

- The preference for handling this material is folding. Folding should occur in such a manner that creasing is not incurred. An alternative is to roll the material onto a core.
- After preparation, the article should be individually wrapped in poly and sealed.
- The sealed package should be placed in an appropriately sized box.
- The box should be filled with contents or packaging to prevent unnecessary movement within the box.

Following these guidelines will allow for the finished fabricated product to arrive at the final destination in good condition. Packaging in a manner other than described above should be conducted on a trial basis to make sure the packaging for the application is suitable.
